

Agentic Shopping Assistant (Conversational Commerce)

Context Traditional e-commerce requires users to manually browse products, compare options, and navigate checkout flows.

Problem Statement Create an AI-powered shopping agent that enables users to discover, evaluate, and purchase products through natural conversation.

AI Capabilities to Explore

Conversational product discovery

Multi-agent workflows for search, recommendation, and checkout

Personalization using user preferences

Tool calling / APIs for product catalog and purchase flows

Example Scenario User conversation:

“I want casual sneakers under ₹5000.”

AI suggests options (e.g., Converse-style shoes)

User asks for comparison

Agent completes purchase via API

Possible Features

Conversational product search

AI-generated product comparisons

Budget and style filtering

Checkout automation using UCP / API-based purchasing

Multi-agent pipeline: Discovery → Evaluation → Buy

Expected Outcome A fully conversational commerce experience where the AI acts as a personal shopping assistant.
